Penetration Testing — Advanced Package

Full Offensive Security Assessment for Modern Cloud & SaaS Systems

1. INTRODUCTION

The Cypentra Advanced Penetration Testing package delivers deep technical security testing across cloud, web applications, APIs, infrastructure, and identity layers. This assessment identifies real-world vulnerabilities before attackers do, helping engineering teams strengthen overall security posture.

2. WHAT WE TEST

Area	Description
Web Application	OWASP Top 10, business logic, authentication, authorization, session security.
API Security	Token handling, rate-limits, broken access control, data exposure.
Cloud PenTest	IAM, misconfigurations, storage exposure, privilege escalation.
Infrastructure	Network scanning, firewall rules, SSH/RDP, exposed services.
Identity Attacks	Password attacks, MFA bypass attempts, role escalation testing.
Social Engineering (Optional)	Phishing simulation and employee awareness testing.

3. TESTING METHODOLOGY

• Reconnaissance & footprinting • Threat modeling & attack surface mapping • Manual exploitation attempts • Automated scanning (validated manually) • Post-exploitation analysis • Cloud privilege escalation attempts • Defense bypass tests (WAF, rate limiting, firewalls) • Reporting with proof-of-concept (PoC)

4. DELIVERABLES

• Executive Summary (High-level findings for leadership) • Technical Report (Detailed vulnerabilities + PoC) • Cloud Misconfiguration Report • Attack Path Mapping (How attackers could move through the system) • Risk Prioritization (Critical, High, Medium, Low) • Recommended Fixes (Clear technical steps) • Verification Testing (Retesting after fixes)

5. SEVERITY CLASSIFICATION

Severity	Definition
Critical	Immediate exploitation risk with full compromise potential.
High	Serious vulnerability requiring urgent fix to prevent breach.
Medium	Important issue that can enable attacks in certain conditions.
Low	Minor weakness with limited impact.

6. TESTING ROADMAP

Day 1–2 — Reconnaissance & cloud footprinting Day 3–5 — Application/API manual exploitation Day 6–7 — Cloud privilege escalation testing Day 8 — Infrastructure and identity attacks Day 9 — Reporting and PoC development Day 10 — Executive summary and debrief meeting

7. NDA + NO LONG-TERM COMMITMENT

• Work begins only after signing an NDA. • No long-term contract required. • The PenTest is a one-time assessment with optional follow-up support.
